# Chamo

| ID | Netsuite (or TSR) | Class | Release Note |
|---|---|---|---|
| CHM-6405 | 16954525 | Bug | A problem sometimes occurred when you attempted to sort items listed on the Item Details screen by location. If you had translated library location names (by editing string translations in the Chamo language file), the software failed to sort based on the translated location names. This problem occurred when both the "Use location ID when sorting location columns" and "By default, sort copies by status, then location" administrative settings were disabled. This is fixed in Chamo 3.2 SP3. When you sort by location on the Item Details screen (and on other screens in Chamo), the software sorts based on the translated location names. |
| CHM-6384 | | Bug | When Chamo built index batches for Solr, it did not attempt to discard duplicate records. Under certain circumstances, this could lead to many duplicate entries being added to the **index_queue** database table for a single bibliographic record, which could potentially cause memory errors during indexing. This is fixed in Chamo 3.2 SP3. |
| CHM-6400 | 16631246 | Bug | When you modified a request's expiration date in Chamo, the software would assign a time of "00:00:00" to the new expiration date. This is fixed in Chamo 3.2 SP3. The software now sets the time associated with the new expiration date to the library's closing time on the day the request expires. If you modify a request but do not adjust the expiration date, the time associated with the expiration date remains unchanged. |
| CHM-6378 | | Bug | When you performed a SOLR query, certain patron record fields were not retrieved in a consistent order. The problem affected patron name and address data. This is fixed in Chamo 3.2 SP3. |
